

SUPPLEMENTARY MATERIAL: THE CERTIFICATE TABLES FOR “A DICHOTOMY FOR ERDŐS PROBLEM 1112”

JOHAN LAND

This supplement to the paper *A dichotomy for Erdős problem 1112: existence of $r_k(d_1, d_2)$ for $k \geq 3$* lists in full the finite certificate tables referenced in its appendix on the certificate tables. Each entry is a hard-core triple (a, b, M) together with a box certificate (x, Y, Z) , asserting that the multiset of x copies of a , Y of b and Z of M has budget $x + Y + Z \leq M - 1$ and subset sums containing M consecutive integers; see the main paper for the definitions, the two-generator/frame mechanism, and the reconciliation of printed rows against the rows decided by the Lean kernel.

These tables are generated mechanically from the canonical data (`data/certificate-data.md`) by `gen-tables.py`, which re-verifies every row — budget $\leq M - 1$ and coverage of M consecutive integers, by exact arbitrary-precision bitmask — at generation time, aborting on any failure. The same rows are transcribed into the Lean 4 development and decided by the kernel, and are exported in machine-readable form as `data/table-A.csv` and `data/table-B.csv` with SHA-256 digests in `data/SHA256SUMS`. Source, proof, and data: github.com/beetree/math_erdos_1112.

Table A: The 172 exceptional Case-T triples (the T-tail lemma of the main paper), all with $a \leq 29$; the scan over $a \leq 3000$ finds no others. Format $(a, b, M) \rightarrow (x, Y, Z)$: the multiset of x copies of a , Y of b , Z of M .
